We saw that the user has only one way to choose the date of his events when we did code investigation,

It allows the user to choose the date according to the event's month only.

We investigate class org.unitime.timetable.events.DateSelectorBackend and discovered that it list only months throw function named public static GwtRpcResponseList<SessionMonth> listMonths(Session session, boolean includeEventDateMappings, HasPastOrOutside check, int monthsBefore, int monthsAfter, boolean disableOutsideEventDates) and we want to add new feature that he can choose the date according to the week in addition to months.

The original program divides the term into months, we want to divide it into weeks also by adding function listWeeks() and use it in the future releases.
